### Abstract

In this study, 309 myxomycete species reported so far in Türkiye are listed. Previously, in the checklist published in 2019, 286 species were reported. With the addition of new records and the removal of synonyms, the number of species have reached to 309 today. These species belong to 5 orders, 12 families and 45 genera. Physarida and *Physarum* are the largest order and genus, respectively, containing the highest number of species. Türkiye is not poor in terms of myxobiota. However, studies on Myxomycetes in this country are still insufficient.

**Keywords:** Checklist, Diversity, Myxomycetes, Türkiye.

### Introduction

Türkiye has an important biogeographic feature as it is located at the junction of Asia and Europe. There are Euro-Siberian, Mediterranean and Irano-Turanian phytogeographic regions. It shows a lot of biodiversity due to its location, seasonal characteristics and geographical features (Sevindik *et al.*, 2022; Sesli *et al.*, 2020).

Myxomycetes are known as plasmodial slime molds. Members of Myxogastrea (Amoebozoa) are unicellular organisms with coenocytic phagotrophic phases. It is a group of amoebic eukaryotes that spreads on other microorganisms in terrestrial ecosystems. Especially the presence of temperature, humidity, pH and organic material is very effective in their development (Baba and Sevindik, 2018; Sevindik *et al.*, 2018; Baba and Sevindik, 2019; Sevindik and Akgül, 2019).

Myxomycetes Stemonitida is represented by five orders as Liceida, Trichiida, Echinostellida and Physarida. It was previously known as Ceratiomyxales ordo. But today it is classified in the Protostelia class. (Spiegel *et al.*, 2004). As of 2023, 1088 myxomycet species have been identified in the world. These species belong to 15 families and 70 genera (Lado, 2023). The classification, which started with the identification of *Lycogala epidendrum* (L.) Fr in 1654, continues rapidly today (Martin and Alexopoulos, 1969). In Türkiye, the first record was reported by Lohwag (1957). As of 2023, myxomycetes are represented by 12 families, 45 genera and 309 species in Türkiye.

### Conclusion

As a result of the literature research, the number of myxomycetes reported in Türkiye was 309. Considering the number of species, it was seen that Physarum was the richest with 45 species. It is followed by Didymium with 30 species, Licea with 23 species, Arcyrica with 21 species and Cibraria with 20 species.
